INTRODUCTION

Ticket Trade is a full-stack web application built to address a common but often overlooked issue — the inability to resell unused tickets in a secure and trustworthy manner.

Many people face last-minute changes in their travel or event plans, leaving them with tickets they cannot use. Existing platforms either do not support ticket resale or lack verification features, resulting in user mistrust and potential fraud.

Ticket Trade bridges this gap by offering a category-specific, secure ticket exchange platform. It leverages modern technologies such as React, Spring Boot, and MySQL, providing features like JWT-based authentication, dynamic ticket forms, and admin moderation.

The platform is designed with both usability and security in mind, ensuring that users can confidently buy and sell tickets for trains, buses, movies, and live events in a verified environment.

OBJECTIVE

The primary objective of the Ticket Trade project is to develop a secure, reliable, and user-friendly platform that facilitates the listing, exchange, and acquisition of tickets across various categories such as trains, buses, movies, and events. The system aims to implement JWT-based user authentication and session management using Spring Security, ensuring that only verified users can access ticket-related operations. A key goal is to offer dynamic, category-specific ticket forms that adapt to the selected ticket type, enhancing accuracy and user experience. Persistent storage of user data, ticket listings, and misuse reports is handled through a MySQL database integrated with Hibernate ORM. The platform also includes an admin moderation panel to review and respond to reported misuse. To support user communication, a contact and reporting mechanism is provided using EmailJS. Additionally, the system is designed with scalability in mind, enabling future integration of features like Google OAuth 2.0 login and secure payment gateways.

ABSTRACTION

Ticket Trade is a full-stack web application designed to streamline the buying, selling, and exchanging of tickets for trains, buses, movies, and events. It addresses the growing need for a secure and transparent ticket resale platform by combining modern frontend and backend technologies. The backend is developed using Spring Boot, Spring Security, Hibernate, and MySQL, offering RESTful APIs, JWT-based authentication, and role-based access control. On the frontend, React, Vite, and Tailwind CSS are used to build a responsive, category-aware interface with dynamic forms based on the type of ticket selected. Users can securely list tickets, browse available options, and report issues through EmailJS integration. The platform includes image upload support for ticket verification, admin moderation capabilities, and a clean, mobile-friendly UI. Ticket Trade provides a scalable, modular, and maintainable solution for real-world ticket resale scenarios, making it a reliable system for users seeking a seamless and fraud-free ticket exchange experience.

REQUIREMENTS

HARDWARE

- **Minimum:** Intel i3 processor, 4GB RAM, 10GB storage
-
- **Recommended:** Intel i5 or higher, 8GB RAM, SSD storage
-
- **Suitable for local development and testing environments**

SOFTWARE

- **Backend:** Java with Spring Boot, MySQL for database
- **Frontend:** React, Vite, Tailwind CSS
- **Tools:** IntelliJ IDEA / VS Code, Git, Postman

THE TEAM

Nihal Yadav

Saumy Mishra

TOOLS & LIBRARIES

Development Tools

- IntelliJ IDEA & VS Code – For efficient backend and frontend development
- Postman – For testing RESTful APIs and verifying authentication
- Git & GitHub – For version control, collaboration, and source code management

Libraries & Frameworks

- Spring Boot, Spring Security, Hibernate – For building secure and scalable Java-based backend
- React, Vite, Tailwind CSS – For modern, dynamic, and responsive frontend interface
- EmailJS, JWT – For email reporting and token-based authentication system

FUTURE ENHANCEMENT

Future versions of Ticket Trade aim to enhance trust, automation, and user experience through several key upgrades. An AI-enabled listing confirmation system will verify ticket authenticity directly via vendor APIs, ensuring only valid tickets are listed. Integration of secure payment gateways like Razorpay or Stripe will support seamless in-app transactions.

AI-driven fraud detection using NLP and behavior analysis will help identify suspicious activity. The platform will also expand into a Progressive Web App or mobile application for better accessibility, along with real-time chat and push notifications for improved user interaction.

Additional features include a user rating system and an admin analytics dashboard to promote transparency, trust, and effective monitoring.

CONCLUSION

Ticket Trade effectively addresses the real-world issue of unused or wasted tickets by offering a well-structured, secure, and user-centric platform for ticket resale and exchange. It caters to common scenarios where users need to transfer their pre-booked tickets due to unforeseen changes in plans. By supporting multiple ticket categories such as train, bus, movie, and event, the platform ensures versatility and relevance to a wide range of user needs.

Core features like JWT-based user authentication, category-specific dynamic forms, and EmailJS-powered misuse reporting contribute to the system's reliability and user trust. The platform streamlines ticket listing and purchasing through intuitive interfaces and clear workflows, enhancing both functionality and accessibility.

The application is built with a powerful Spring Boot backend that ensures stable business logic and secure API handling, while the frontend, crafted using React and Tailwind CSS, delivers a responsive, smooth, and visually appealing user experience. Data security, form validation, and modular code design have been prioritized throughout development, making Ticket Trade not only efficient in its current form but also well-prepared for future enhancements and scalability.
